

# SuperCal SO4 or FGD gypsum: make the smart choice!

*Not all gypsum products are alike. There are several factors to consider before you order a product.*

## Why choose SuperCal SO4?

**PROVEN.** Calcium Products Inc. has been providing high quality products for 25 years, mined from one of purest sources of gypsum in Fort Dodge, IA. Many third-party researchers confirm SO4's performance.

**PURE.** There are no heavy metal contaminants in SuperCal SO4 while flue gas desulfurization (FGD) gypsum has been shown to contain mercury, cadmium and chromium.

**QUALITY.** SuperCal SO4 is ground to a fine particle size then pelletized. The result is a uniformly-sized, low dust, easily blended and spread product. FGD may contain 10% moisture.

**USE LESS.** Typical SO4 application rates are 200-500# per acre, yet it out performs high rate applications. FGD rates are 500-2000# per acre.

**EASY TO APPLY.** SuperCal SO4 can be blended with other granular fertilizers and is easy to apply. FGD cannot be blended and must be applied via lime- or manure-type spreader so uniform application is unlikely.

**ADDED BONUS.** Plants can't use what they can't absorb. The calcium and sulfur in SO4 are immediately plant-available, since the sulfur is in sulfate form. FGD is in the sulfide form, not plant-available.

**QUICK TO WORK.** Plants respond quickly to an application of SuperCal SO4; increased yields are realized in the first season.

**With Super Cal SO4 you are guaranteed the following:**

- quality product,
- >95% purity (no heavy metals),
- ease and flexibility of application
- performance, increased yields and improved soil characteristics

Initial costs should not be the only consideration. Applying high rates (of a cheap product) doesn't make it better!
