

Nebraska Research Summary

YIELD RESULTS

Average yield increase of 14 bu/A vs. no sulfur

Overview

A series of trials were conducted in Nebraska to evaluate the effect of SO4 on corn yields as a sulfur source compared to no sulfur.

Background

- Conducted by Real Farm Research
- 4 trials in 3 counties
- 2014 - 2016
- Various soil types tested
- Average application rate of 100 lbs/A (17 lbs Sulfur/A)
- Trials included pre-plant applications

SO4 Increases Corn Yields

HIGHLIGHTED TRIALS

Webster County

- Year: 2014
- Location: Blue Hill, NE
- Silt loam soil type
- SO4 Rate: 100 lbs/A pre-plant
- 17 bu/A increase

Valley County

- Year: 2016
- Location: Ord, NE
- Sandy loam soil type
- SO4 Rate: 100 lbs/A pre-plant
- 10 bu/A increase
