

Soybean Yield Advantage from 98G Maintenance Rate Application

YIELD RESULTS

Average yield increase of 2.7 bu/A vs. the untreated control

Soybean Yield Response to 98G Maintenance Rate Application

Overview

Trials were conducted to evaluate the effectiveness of a 98G maintenance application rate on soybean yield. A 98G maintenance application rate is used to neutralize the acidifying effects of nitrogen fertilizer and is generally 100-200 lbs/A.

Background

- Compilation of 10 trials in Iowa, Illinois, Nebraska, and North Dakota
- Silt- and clay-loams soils
- 2020-2022 crop years
- Average application rate of 149 lbs/A
- All applications were pre-plant applications

Trial Locations
