

Soybean Yield Advantage from 98G Maintenance Rate Application

YIELD RESULTS

Average yield increase of 3.1 bu/A vs. the untreated control

Overview

Trials were conducted to evaluate the effectiveness of a 98G maintenance application rate on soybean yield. A 98G maintenance application rate is used to neutralize the acidifying effects of nitrogen fertilizer and is generally 100-200 lbs/A.

Background

- Compilation of 13 trials in Iowa, Illinois, Nebraska, Minnesota and North Dakota
- Silt- and clay-loams soils
- 2020-2023 crop years
- Average application rate of 187 lbs/A
- All applications were pre-plant applications
